

## Rigorous standards met by Hart's shutter

This shutter from Hart Door Systems delivers 60-minute fire resistance to match the requirements of this major London airport.

The shutter, which is positioned over a conveyor, is part of an order for 27 being installed in two terminals. A Hart spokesman says the shutters comply with rigorous standards required by the client "with a galvanised finish, the shutters interface with fire operating systems and the conveyors."

Hart's shutters deliver from 30 minutes to four hours fire resistance subject to customer requirements, building regulations and insurance requirements. The British Research Establishment LPCB department has tested, assessed, certified and monitored Hart's range of fire roller shutters which can be manufactured up to 10m wide and 7m high. ISO 9001 certification ensures production and installation are completed to all relevant standards including health and safety during manufacture and installation. A controlled labelling procedure ensures product identity, traceability and compliance.
