

News Release

Advanced Valve Solutions UK Ltd Celebrates Their First Successful Training Workshop in Crewe.

Advanced Valves Solutions (AVS) was established in 1998 to provide solutions to the Power Generation Industry when excessive wear, thermal cracking and stressing became a major problem – resulting in millions of pounds in lost revenue. AVS takes their industry knowledge and actively shares it with key customers and end users to create a detailed understanding of cause and effect in power generation.

The first workshop covered the challenges that engineers face in relation to IP and HP bypass stations. The feedback has been excellent according to AVS.

UK Director, Rik Barry explained: “this course was offered as a result of industry demand. We ask the industry what their problems are and cater for them with bespoke courses that offer the up-to-date innovations and, more importantly, a genuine fix for their issues.”

The workshop was attended by Power Station engineers and graduates throughout the UK and Ireland with special guest speakers being drawn from both OEMs and end users with ‘true-to-life’ case studies being presented. The delegates included staff from Scottish & Southern, Suez, Sita, ESB, Uniper and Intergen, as well as students from the MMU and South Cheshire College. There were 21 delegates in total.

Dave Colston, an engineer with SSE stated: “It was a good day, with excellent subject matter and good presentations.”

Most of the courses are offered free of charge and include refreshments and lunch. The next course will be on the 13th February 2018 and will concentrate on de-superheater, PRDS and attemporator issues and new technology/innovation to maintain continuous plant operations.
