

The waterproof **MM2008** thermometer from UK manufacturer, TME, is helping premises and facilities managers streamline the raft of essential heating and hot water checks required for the prevention of Legionnaires' disease.

The thermometer's built-in timer with 1 and 2 minute countdown buttons greatly simplifies timed temperature tests on hot and cold running water from taps and showers, saving engineers' time and cutting costs. The thermometer is offered as part of a single kit, the **CLEGK2** which includes TME's unique **KS01-S** dual surface/immersion probe, suitable for use on both pipes AND running water.

TME is the UK's specialist manufacturer of thermometers and probes for legionella prevention. Other innovative products include the company's easy to install **TCWALLPORT** system for low cost remote temperature monitoring, and **MM7000** Barcode Scanning Thermometer for paperless temperature management of assets – now compatible with cloud-based fixed monitoring systems.
