AUTOAgility; work management without the guess work and administration.

Agility, the market-leading Asset and Maintenance management software solution from SoftSols Group, seamlessly manages work with the new 'end to end' solution, AUTOAgility.

Maintec 2017, (21st to 23rd March at the NEC) will see SoftSols Group showcase the brand new intelligent work capture and deployment solution AUTOAgility.

Based on over 30 years' experience in managing work across a variety of sectors; AUTOAgility uses dynamic, behind the scenes rules to ensure the right detail and quality of information is captured for each work request and then automatically deploys it to the most appropriate resource for completion.

Using a dynamic question/response driven helpdesk, AUTOAgility ensures all the relevant information for each request is quickly and completely captured. Nothing can be overlooked or missed out that could prevent the work from being dealt with and completed right first time. AUTOAgility then finds the person with the right skills and availability and deploys the work to them, ensuring the work is started and completed as quickly as possible. AUTOAgility can even take into account physical location and assign work to the closest available resource.

Work is captured and completed in one process; your team work on jobs appropriate to their skills and savings are made across administration and scheduling. All done automatically with Agility.

Visit stand M300 to see AUTOAgility plus the other the latest features from Agility. David Hipkin, SoftSols Group MD, will also be taking part in the Maintec Dialogue session on IoT on Tuesday 21st March.
