

Chemical cleaning and descaling pumps for building services engineers

New from Kamco are two purpose built descaling pumps, the Scalebreaker C90 and C210, designed for descaling commercial and industrial boilers, chillers and plate heat exchangers.

Used with the appropriate chemical, the pumps make it simple for plant and works engineers and contractors to clean equipment with in-house staff at a time most convenient for production schedules.

All pumps have an integral tank for descaling / cleaning chemicals, with the pump body completely contained within the tank, avoiding the need to prime the pump before use. The drive motor is mounted on top of the unit, away from acid splashes, removing the need for mechanical seals.

Both pumps have 200mm wheels to make them easy to manoeuvre on site. Flow and return hoses are included, so that contractors are ready to commence cleaning with minimal set-up time. The larger unit, the Scalebreaker C210, has a 125 litre tank so that it can be used on larger plant and equipment.

Scalebreaker pumps incorporate a fresh water flushing facility so that equipment can be easily flushed after the cleaning process, and used chemicals discharged to waste.

The direction of circulation can be instantly reversed with a unique flow reversal device, giving much quicker and more effective descaling and cleaning. Pumps can handle even the strongest acids, and are built for a long, maintenance-free life.

Both pumps are available in either 230 or 110 volt motors.
