

Balluff run training courses throughout the year. The objective of our hands-on workshops is to teach the participants the optimal way to solve tasks related to industrial applications. During the training, we will share our practical knowledge based on many years of experience as a manufacturer.

To ensure the best environment for learning, our workshops are conducted in small groups. We have a variety of standard courses which include sensor technology basics, development of vision control applications, use of RFID systems in manufacturing and intelligent network connection systems with IO-Link interface. Additionally, we have tailor made courses, where we will discuss your individual needs.

Participants are encouraged to bring examples of their own applications to the training. During the workshop we look at solving these applications together, this hands-on aspect will have the opportunity to consolidate their theoretical knowledge in the scope of proper selection of components at the design stage. The combination of solid theoretical basis and practical exercises offers the best conditions for finding an optimal solution to application issues. The acquired knowledge will allow the participants to achieve greater efficiency.

Workshops are held at our Customer Support and Training Facility in Cheshire, or on-site at customer premises.
