

Interactive Noise Warning Sign tells workers when to wear hearing PPE

How do your workers know when to wear hearing PPE and when it's safe to remove it? Millions of workers are affected by high noise levels in their workplace loud enough to damage their hearing. Static noise warning signs and mandatory hearing protection zones aren't ideal solutions, and wearing hearing defenders constantly over an entire shift is flawed from both health and safety and staff morale standpoints.

The **Pulsar SafeEar**, a simple **noise-activated warning sign** from Pulsar Instruments provides the answer. Thanks to its clearly identifiable noise-activated alert symbol, staff and visitors can take immediate action to protect themselves from noise by reaching for hearing protection or by taking action to reduce the noise levels around them.

- Highly visual warning message
- Quick and simple to install and use
- Lights up when a pre-set noise level is exceeded
- Triggers from 40dB(A) to 114dB(A)

You can use the SafeEar to create hearing protection zones and extend its range by connecting Remote Units to a Master sign. Flashing Warning Beacons for extra visibility are available, and Data Loggers can be used for those wanting to record and analyse long-term workplace noise levels.
