

On-site compressed air pressure dew point monitoring is now accurate and easy with the S505 handheld tester from SUTO-iTEC GmbH and Measure Monitor Control. Read the results straight from the screen: the S505 measures pressure dew point directly through internal pressure and dew point sensors, removing the need for calculations or correlating readings, saving time for more tests.

Measuring is faster too. The dedicated measuring chamber allows the sensor to be isolated while not in use, meaning no more waiting forever for readings to stabilise.

This handheld tester features interchangeable sensor modules for low -100 ... -30°C or high -50 ... +20°C ranges with easy to read colour touchscreen display and integral datalogger. The S505 recorded data can be downloaded through USB for later spreadsheet analysis or archiving and printed directly to mobile Bluetooth printers for immediate hard copy results.
