Jacob UK editorial

## **JACOB Logistics Centre is now open**

The new logistics centre at the JACOB headquarters in Porta Westfalica, Germany, is now fully operational.

With more than 7,500 square metres of space, the state of the art hi-rise logistics centre became effective during January, following the transfer from the existing warehouse over the Christmas holiday period.

JACOB (UK) Director John West said: "The new logistics centre will impact positively on Jacob's ability to reduce order delivery times and enhance the operational efficiency of the supply system to meet customer needs in the UK and the 40 countries that the Jacob Group serves worldwide".

13,800 pallet locations hold up to 8000 standard components of the extensive range of modular pipework, stacked up to 21 metres in height. Five dedicated packing stations handle parcel shipments and trucks are loaded via 6 loading platforms. The modular system wall thicknesses are 1-3mm, with diameters from 60mm to 1600mm in galvanized, stainless-steel and powder coated finishes.

JACOB (UK) has over forty years experience of designing and supplying modular pipework systems for the engineering industry. JACOB manufacture thin-walled, modular pipework systems and ducting, with components for handling solids and bulk goods, extract-lines, gravity chutes and air conveyor systems. JACOB cater for all types of pipework installation.
