

Another solution from Hart

Faced with the escape of odours over neighbouring housing, an Essex-based company opted for a solution provided by Hart Door Systems.

Hart's sales manager, Julian Britnell, explains that an established client of Hart Door Systems, with a depot in Essex, was experiencing issues with vapour and smoke escaping from an open-ended building while lorries were being loaded with tarmac.

"The odour from this could be carried in the wind to nearby local residents and our client sought a solution from us to prevent this happening," says Mr. Britnell.

"We installed three Speedor Supers, the original tensioned blade high speed door developed for frequent usage openings. The doors in this instance are activated by overhead

movement sensors which open the doors as lorries approach giving them access inside, once the lorries have fully entered the building the doors then close allowing the lorries to be loaded behind closed doors so preventing the escape of vapour and smoke. All doors have safety photocells and safety bottom edge features," adds Mr. Britnell.
