

Planned Maintenance to Improve Productivity and Profitability

In most manufacturing and production processes, maintaining consistent environmental conditions is essential in achieving optimum performance of people and equipment, and relative humidity is often a critical variable.

Breaching required rh levels can also result in consequences such as costly financial penalties, enforced production downtime or machine breakdown and permanent damage to product.

By setting up a [Planned Maintenance contract](#), factory or facilities managers can have peace of mind that equipment will be regularly serviced and maintained, ensuring consistent performance and pre-empting breakdowns due to out of date or faulty parts.

[Humidity Solutions'](#) Eddy Capraro has responsibility for Planned Maintenance – an area which has seen steady growth in recent years. Eddy comments 'Businesses are increasingly seeing the value of Planned Maintenance as a cost- effective way of keeping equipment working at its optimum throughout its life, reducing workload and worry for site managers.'
