A Family of Versatile USB Temperature Data Loggers supplied with configuration software

The EL Series of USB temperature data loggers cover a measurement range of -200 to +1350°C for type K; type J & T ranges are also available . The data loggers can store up to 16,382 readings and are supplied with a long-life replaceable lithium battery, allowing the units to log data continually for up to one year (depending on logging rate and temperature).

Data logger configuration software is supplied, allowing the user to easily set-up the data logger. Selectable parameters include logging rate, measurement units, high & low alarms and start-time. The logged data is downloaded via the configuration software. Once downloaded data can be graphed, printed or exported to other applications.

The data logger configuration software is compatible with Windows 2000/XP/Vista/7.

Alternative configurations are offered to meet the requirements of different applications and an integral LCD display is incorporated in some versions.

Features include status indication via red and green LEDs, programmable alarm settings, immediate/ delayed and push-to-start logging.
