

**Power tools, lifting harnesses and other assets missing again?!**

Intelligent locker systems and electronic storage cabinets are the latest innovation to take the maintenance sector by storm as they are saving thousands of pounds for engineering departments all over the UK by putting a stop to money being wasted on replacing tools that have been lost, misplaced and stolen.

The iLockerz storage cabinets use ground breaking RFID technology to track tools in and out whilst also recording the details of the user that carried out the transaction.

The result is that engineering teams now know exactly who has a piece of equipment that is out, so that users can be found quickly and the tool returned or re-used without the -ever common place-hours of searching.

Other notable features include the ability to associate equipment use with permits to work, and the impressive calibration programme that automatically locks down a tool when it has been in use for the pre-set number of hours.

All of this information is then packaged up into easy to digest email reports that appear in your inbox instantaneously, alongside the list of all tools that are still out from the days work.

To see the iLockerz systems first hand the team are exhibiting at the Maintec exhibition, the UK's leading show for Maintenance Plant and Asset Management, this March at the NEC. Be sure to add this to your plan for your visit!

For free show tickets you can email the iLockerz office on [sales@ilockerz.com](mailto:sales@ilockerz.com) , and they will arrange a free pass and convenient time for you to see the tool tracking system on the stand.
